## Open questions

2018 version

- 1 How do the OpenCM micros communicate with the Arduino minis?
- 2 How does the male Arduino minis communicate with the linkage bar controller to signal the drive levels?
- 3 What does the light on the linkage bar signal?
- 4 How does the controller on the bar control the backlight (the light has + /- connections only)?

- 1 I didn't look in depth, the aim of the new system is to avoid it
2. Same.
3. The backlight indicate which male has the highest drive (Thus the priority to stop the bar)
- 4 . Seems like it driven through an amplifier in the schematics
